ATTACHMENT I

PHARMACEUTICAL COMPOSITION FOR THE TREATMENT OF SYNDROM X OF REAVEN

The present invention relates to a pharmaceutical composition comprising as active ingredient a compound selected among somatostatin or one of its analogs (as herein defined), diazoxide or one of its analogs (as herein defined), cyclothiazideor one of its analogs(as herein defined) and metformin, for the treatment of syndrome X of Reaven (also called "Hyper Insulinemia syndrome" or "The Deadly Quartet").

Somatostatin and its analogs, e.g. octreotide, are known for the treatment of the reduction of the secretion of Insulin caused by insulimonas. Moreover, they are known for the treatment of certain tumors, gastrointestinal diseases, etc. However, their effectivity for the reduction of the resistance to insulin has so far not been known.

It is also known that Diazoxide, Cyclothiazide and Metformin achieve the reduction of the resistance to Insulin. Moreover, it is known that Metformin is used in the treatment of Diabetes and reduces risk factors in carbovascular diseases in NIDDM.

Diazoxide, Cyclothiazide and Metformin have the following formulae:

a. Diazoxide: 7-chloro-3-methyl-24-1,2,4-benzothiodiazine 1,1-dioxide.

b. Cyclothiazide: 3-bicyclo[2.2.1]hept-5-en-2yl-6-chloro-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide.

c. Metformin: N,N-Dimethylimidodicarbonimide diamide.

However, those compounds have so far not been known for the treatment of the risk factors of syndrome X of Reaven.

Syndrome X includes, inter alia, the following risk factors: a. excessive blood pressure; b. dislipidemia, i.e. increase of the amount of Triglycerides in the blood, reduction f the amount of HDL and increase of the amount f LDL, c. excessive blood

coagulati n due to Plasminogen Activator Inhibitor-1 (PAI-1) increased in the blood; d. central obesity; e. Glucose intolerances - from ocult Diabetes to vert Diabetes f. increase of Insulin in the blood, i.e. the pancreas secretes more Insulin in order to overcome high Insulin resistance.

All the risk fators of syndrome X of Reaven are, inter alia, caused by a high resistance to Insulin. Thus, apparently said symptoms could be treated simultaneously if there would be a reduction to the resistance to Insulin.

Said risk factors either separately but mostly in combination are decisive factors in the appearance of Ischemic Heart disease, e.g. Angina Pectoris, Myocard Infarct; Cerebral Vascular Diseases and the like.

Until now, all said risk factors had to be treated separately as there was no pharmaceutical composition which could treat simultaneously all of them. However, said separate treatments are not always effective as very often the treatment of one risk factor severes the condition of another risk factor. It has therefore been desirable to find a pharmaceutical composition which can treat simultaneously all the various risk factors which are included in syndrome X of Reaven.

We have now found that due to the fact that the reduction of the resistance to Insulin can be achieved by administering a compound selected among somatostatin or one of its analogs (as herein defined), diazoxide or one of its analogs (as herein defined), cyclothiazide or one of its analogs(as herein defined) and metformin, said treatment may enable the treatment of all risk factors of syndrome X of Reaven simultaneously.

The present invention thus consists in pharmaceutical preparations for the treatment of the risk factors of syndrome X of Reaven comprising as active ingredient a compound selected among somatostatin or one of its analogs (as herein defined), diazoxide or one of its analogs (as herein defined), cyclothiazideor one of its analogs(as herein defined) and metformin.

The present invention also comprises the use of a compound selected among somatostatin r one of its analogs (as herein defined), diazoxide or one of its analogs (as herein defined),

cyclothiazideor one of its analogs (as herein defined) and metformin in the preparation of a pharmaceutical preparation for the treatment of the risk factors of syndrome X of Reaven.

Analogs of somastostatin in connection with the present invention mean any analog compound of somatostatin which biologically activate one or more somastostatin receptors. Said receptors cause the reduction of the resistance to Insulin and thus enable the combined treatment of all risk factors of syndrom X of Reaven and are thus effective in primarily & secondary preventing and/or treating Ischemic Heart disease, such as, Angina Pectoris, Myocard Infarcts ; Cerebral Vascular Diseases, etc.

As receptors there should be mentioned, inter alia, the following human somatostatin receptors, which are described in Steven W.J. Lamberts, et al. 1996. Octreotide.. The New England Journal Med. Jan. 25. pp. 246-54. These receptors are:

1. hSSTR1
   Present in the brain, lung, stomach, jejunum, kidneys, liver and pancreas. It is located on chromosom 14q13. It has 391 amino acids and its formula is given in Yamada et. al., Biochemical and Biophysical Research Communications, 1993, Vol. 195, No. 2., pages 844-852.
2. hSSTR2
   Present in the brain and in the kidneys, It is located on chromosom 17q24. It has 369 amiono acids and its formula is given in Yamada.
3. hSSTR3
   Present in the brain and in the pancreas. It is located on chromosome 22q13.1. It has 418 amino acids and its formula is given in Yamada.
4. hSSTR4
   Present in the brain and in the lung. It is located on chromosome 20. It has 388 amino acids and its molecular weight is 41,867. Its formula is given in Yamada.
5. hSSTR4
   Present in the brain, heart, adrenal glands, placenta, pituitary, small intestines and skeletal muscles. It is located on chromosome 20p11.2. It has 364 amino acids,

its molecular weight is 39,176 and its formula is given in Yamada.

All receiptors have common features:

1. They have a similarity in the configuration in the seven areas which do extend out of the membrane TM1....TM7)
2. Asp-Arg-Tyr at the end of the NH -terminal of the second loop which is in the cell.
3. Aspartic acid (Asp) is located in the third loop outside the cell.

The receptors which are especially important in reducing the Insulin resistance are receptors 2 and 5, also but less receptor 3. Receptors 1 and 4 are less important in this respect.

The use of somatostatin is not always satisfactory as it is effective only for a short time. Therefore the use of Octreoide, the most known analog of somatostatin or of another long acting Somatostatin, is preferred.

The analogs of somastostatin should comprise the chain D-Trp-Lys. Said chain constitute the critical core of the active analogs and is essential for the activation of the receptors.

Most analogs comprise the chain Phe-D-Trp-Lys.

Many analogs comprise the chain Phe-D-Trp-Lys-Thr being present in positions 7 - 10 of Somatostatin 14.

Suitable analogs of somatostatin being part of the pharmaceutical composition according to the present invention are, for example,:

1. Octreotide.

3. Lanreotide.

Analogs of Diazoxide and Cyclothiazide are compounds which affect the receptor being adenosine 5'- triphosphate sensitive K^+ channels.

Suitable analogs of Diazoxide and of Cyclothiazide are indicated, for example, in a paper of Bertolino et al., appearing in Receptor-Channels 1993 1(4):267-78 "Modulation of AMPA/Kainate Receptors by Analogs of diazoxide and cyclothiazide in thin

slices of rat hippocampus". However, the analogs which may be used in the pharmaceutical composition according to the present invention are not restricted to the analogs given in said paper and any other analog having the proper properties may be used.

The pharmaceutical preparation according to the present invention may also comprise additional compounds such as compounds having an additional pharmaceutical effect, carriers, solvents, emulgamators, etc.

In view of the fact that diazoxide sometimes has undesired salt and water retention, which may be relieved by certain thiazide diuretics, e.g. 6-chloro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide (Chlorothiazide); 6-chloro-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide (Hydrochlorthiazide); 6-chloro-3-(dichloromethyl)-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide (Trichlormethiazide); or 6-chloro-3,4-di-hydro-2-methyl-3[(2,2,2-trifluoroethyl)thiomethyl]-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide (Polythiazide), the pharmaceutical compositions according to the present invention may comprise, in addition to Diazoxide and/or one of its analogs, as an additional compound having a pharmaceutical effect, one or more of the above thiazides or a thiazide having similar properties. Said thiazide diuretics may prevent the salt and water retention.

The present invention also comprises a method for the treatment of the risk factors of syndrome X of Reaven by applying to a patient a pharmaceutically effective dosage of a pharmaceutical preparation according to the present invention comprising a pharmaceutically effective dosage of a compound selected among somatostatin or one of its analogs (as herein defined), diazoxide or one of its analogs (as herein defined), cyclothiazide or one of its analogs(as herein defined) and metformin.

Said dosage should preferably not exceed 50μg/kg/day of the active ingredient (calculated on Octreotide), preferably not exceeding 40μ/kg/day. Said dosage is given in any suitable manner. It may be given as one portion once a day or even in two days or more when given in slow release form, or being divided into 3-4 dosages which are applied in equal periods of time for Octreotide, or 1 - 2 times a day for analogs with a higher $t_{\frac{1}{2}}$.

Said dosage should preferably not exceed 8 mg/kg/day in the treatment of the activ ingredient (calculated on diazoxide) in adults, and preferably not exceed 15/mg/day in the treatment of children. The amount of Metformin applied should preferably not exceed 2.5 g/day divided into 2 - 3 portions.

Should any of the above thiazide diuretics be added the added amounts are, for example, the following:

Chlorothiazide: 500 - 2000 mg a day;
Hydrochlorothiazide: 50 - 200 mg a day;
Trichloromethiazide: 12.5 - 50 mg a day;
Polythiazide: 1- 4 mg a day.

Said dosage has to be re-calculated on the basis of the analog being the active ingredient. Moreover, the exact dosages have to be adapted to the condition of the patients and to its specific properties e.g. weight, age, etc.

The composition may be administered in various manners. This depends in particular on the analog being the active ingredient. Thus octreotide is advantageously injected sub-cutaneously as a saline solution. Cyclo(N-Me-Ala-Tyr-D-Trp-Lys-Val-Phe) is advantageously administered per os.

The treatment is performed, as indicated above, against the risk factors of syndrome X of Reaven, in particular against the following diseases in order to primarily and secondarily prevent and to treat:

A. 1. Ischemic Heart diseases, e.g. Angina Pectoris and Myocard Infarcts;
   2. Cerebral vascular diseases in order to prevent Transient Ischemic attack (TIA) and Cerebrovascular accident (CVA);
   3. Intermittent Claudication;
   4. Ischemic Bowel disease; and
   5. Impotence due to a Periferal vascular disease.

B. Prevent excessive blood coagulation (high PAI-1 in the blood) in order to primarily prevent MI, CVA, Renal vein trombosis, etc.

C. Lower body weight (which is also a risk factor for high blood pressure, Glucose Intolerance, etc.)

Said diseases are mainly caused, as indicated above, by a

high resistance to Insulin.

The present invention will now be illustrat d with reference to the following experiment (all injections are given into the hollow space of the Peritoneum):

60 fat male rats of the Zucker species, aged 7 weeks having an average weight of 225 g. 54 rats of same are divided into 3 groups:

Group A receives injections of Octreotide in a 0.9% NaCl saline solution in a high dosage (40μg/kg/day);

Group B receives injections of Octreotide in a 0.9% NaCl saline solution in a low dosage (20 μg/kg/day); and

Group C the control group, receives an injection of a 0.9% saline solution. The volume of the 0.9% NaCl is identical with the volume being injected into Group A and B (At the beginning of the tests the rats have approximately the identical weight and they therefore receive the identical volume of injections).

All rats receive the same amount of Food (Pair Fed). Said amount is chosen according to the group eating the lowest amount. Thus, the influence of the drug is isolated.

The rats are located in a room changing light and darkness in order to simulate natural surroundings, as in general they eat in darkness. The rats drink water freely.

The rats are weighed twice a week. At the end of the experiment the rate change of the weight is being calculated. The amount of food eaten per week is measured and the amount eaten each day is calculated. (The influence of the Octreotide on the amount of food eaten by the rats is not checked. They eat the identical amount of food.)

Six rats are tested before the beginning of the experiment. Six rats from each group are separated after 2 weeks, 4 weeks and 8 weeks and an Intra-Peritoneal Glucose Tolerance Test (GTT 1.0g Glucose/kg BW) is performed after a fast of 12 hours during which the rats do not receive any medicament or food.

Blood is taken from the Supra-orbital sinus with slow anaesthesia with CO_2.

At zero time, i.e. before the Glucose load 2 cc of blood are taken from each rat.

½ cc of blood is put into a test tube which contains Heparin

and the conc ntrations of Glucose and Insulin are determined; and

1½ cc of blood is put into a test tube which contains Na_2EDTA 0.1% and the concentrations of Cholesterol, Triglycerides, HDL and LDL are determined.

At 15, 30 and 60 minutes after the Glucose load, ½ cc of blood is taken from each rat and put into a test tube which contains Heparin and the concentrations of Glucose and Insulin are determined.

After the Glucose tolerance test each tested rat "leaves" the experiment.

The materials used in the experiments:

Octreoide manufactured by Sandoz Basel.

0.9% NaCl

30% Glucose

Not sterilized food for mice and rats manufactured by Kopolk, Petach Tikva. Catalogue No. 19510. Gross energy 3,950 kCal/kg. Digestibality energy of the food in rats 3,150 kCal/kg.

The laboratory tests are performed as follows:

1. Glucose is tested by the Glucose Oxidase method in a kit of Boehringer Mannheim called Glucose GOD-Perid Method 2 x 300ml catalogue No. 124028. The test is performed on the day or the following day on which the blood is taken.

2. The Insulin is tested by the Radio Immuno Assay (RIA) by a SB INSIK-5 kit of Sorin Biomedica.

The method is performed by the general method known for the test of Insulin by said kit.

3. The total Cholesterol is tested by the CHOD-PAP method. The total cholesterol comprises VLDL + LDL + HDL. The kit with which the test is performed is manufactured by Boehringer Mannheim and the cholesterol reagent is MPA3 catalogue No. 236691 4 x 500ml.

The HDL is tested by precipitating LDL and VLDL with Heparin $MnCl_2$ and then the total cholesterol is tested. VLDL is calculated by T.G./5. LDL is calculated by the formula

LDL = totaL cholester l - (VLDL + HDL)

4. The Triglycerides are being tested by the peridochrom T.G. GPO-PAP meth d. The kit is manufactured by Boehringer

Mannheim and the reagent has catalogue No. 701904 15 x 32ml.

The data received are worked up by standard methods for this purpose. The results show that the Insulin resistance is significantly lowered, there is an increase in the level of HDL and a decrease in the level of LDL and of the Triglycerides. A decrease in the rate of weight gain of young obese rats is observed, which implies a decrease in the weight of adult obese rats.

The Insulin resistance (Insulin Sensitivity Index) is determined using the dynamic test - the Glucose Tolerance Test (GTT). An integration of the area under the curve (AUC) of Glucose and Insulin in the period of 1½ hours is measured and the determination of the ratio between them gives a good estimate of the Insulin resistance.
